

轴 承 故 障 检 查 仪

HB-1 measures the insulation and voltage between the rotor and stator. The reading of the detector can reflect the magnitude of mechanical impact, wearing and lubricating condition of the bearings. The readings can be got directly while the bearing is still in operation, without being affected by the noises and vibration caused by the machine. It can examine the condition of new-mounted bearing and display their qualitative parameters. It can measure the concentricity of the rotor and stator, and proper position of shaft couplings of the electrical machinery, as well as the voltage of electrical motor's shaft.

读数 显示机械撞击大小程度并直接显示轴承的磨损及润滑状况。可在设备正常运转中测量，且不受机械噪声和震动影响。对新安装的轴承能定性显示其状态。测定电机转子与定子同心及联轴器安装位置是否正确。测定电机轴电压参数。
